Summary

Hands-on AI engineer who builds the workflows himself, from requirements to production. I started on the collections floor, then spent 7 years engineering the servicing, collections and fraud systems I used to work in, inside a federally regulated bank. Through WiseForge, my independent practice, I build autonomous LLM agent systems with audit trails, human approval gates and measured failure analysis. I work directly with executives and operators, push back on incomplete requirements, and ship without a business analyst in the middle.

AI & Automation Work — WiseForge (Founder, sole engineer)

Cowork — autonomous multi-agent pipeline · case study

- Built and operate a 24/7 pipeline of 16 role-specialized LLM agents (spec writers, implementers, security and architecture reviewers, testers, a final ship/hold gate) across 5 parallel lanes on Claude Code and the OpenAI API.
- Designed the control layer that lets it act on its own: 3 reviewer agents vote independently, and a change ships only with unanimous approval, passing checks and room under a daily cap. An emergency stop freezes it after 2 human reversals in 24 hours.
- 0% of auto-approved changes were reverted during the controlled ramp, with every decision's rationale logged for audit.
- Instrumented every action as structured logs and classified recurring failures: agents looping on one task, lanes sitting idle with work available, lost state that broke escalation.
- Ranked and shipped 8 fixes from that audit, lifting productive capacity from 9.2% to 30%+, and published what the numbers do not prove.

LoanOps Agent Control Plane · demo

- AI copilot for regulated loan servicing: a guardrails engine blocks forbidden actions, every recommendation cites the policy behind it, and high-impact steps require human approval, with a tamper-evident audit timeline.

Simplicity — production AI product · wiseforge.dev

- Designed, built and shipped solo: streaming APIs, OAuth 2.0 + PKCE, multi-model routing, usage enforcement and Stripe billing.

IronLog — fitness and health tracking platform · ironlog.space

- Designed, built and run solo: an offline-first fitness PWA (workouts, nutrition, body metrics, progress photos, AI coach) serving a gym community of about 1,000 users, part of a five-app ecosystem with single sign-on on one Supabase backend.
- Built for reliability and privacy: row-level security on every user table, hashed PINs with lockout, an offline sync queue that replays on reconnect, and an admin dashboard whose views strip personal data.

The Builder — multi-stage generation, multi-pass model review, automated fixes and deployment, with structured outputs and audit logging across model providers.

Professional Experience

Lead Data Analyst — LendKey Technologies · Jun 2026 – Present

- Own the roadmap for migrating 35+ lender reports (reconciliation, performance, regulatory call reports) from SQL Server/SSRS to Databricks and Sigma for 200+ lenders, onboarding a new servicing data source.
- Retired 15 legacy reports so far and built self-service access that saves about 20 hours a week of ad hoc data work.

Lead Business Engineer & Execution Consultant — SLM Corporation (Sallie Mae Bank) · Mar 2019 – Jun 2026

- Built internal tools across five operating departments (servicing, collections, fraud, onboarding/training, incentives) that replaced manual call QA, infraction grading and fraud case tracking, saving each department about 4 hours a day.
- Worked directly with product owners and department managers to turn loosely defined operational problems into shipped systems, owning prioritization and delivery.

- Architected and owned production .NET/C# systems end to end (schema design, REST APIs, OAuth/OIDC) on SQL Server and Snowflake, deployed with AWS, Kubernetes and Terraform, under strict uptime, data-integrity and audit requirements.
- Built AI-powered documentation and test-automation tooling and a SAS-to-Python conversion pipeline on AWS Lambda and S3, cutting manual reporting effort 60%.
- Served 1,000+ business users with Power BI and Snowflake reporting backed by shared metric definitions, automated data-quality gates and change controls.
- Led and mentored 4–6 engineers and analysts while staying hands-on in the code.

Personal Loan Consultant · Collections Specialist — Sallie Mae · Jun 2017 – Mar 2019

- Worked collections and loan servicing directly, the operational ground I later automated as an engineer.

Technical Skills

- **AI & automation:** Claude API, OpenAI API, Claude Code, multi-agent orchestration, LLM review and approval gates, structured outputs, guardrails, human-in-the-loop workflows, audit logging
- **Languages:** Python, TypeScript/JavaScript, C#/.NET, SQL, Bash
- **Data:** Snowflake, Databricks, Sigma, Power BI, T-SQL, Pandas, data validation and reconciliation
- **Infrastructure & security:** AWS, Kubernetes, Terraform, GitOps, CI/CD, OAuth/OIDC, Supabase, Cloudflare, Vercel

Education

Bachelor's Degree, Business Administration and Management — Wilmington University
